

UI WIREFRAMES & USER FLOW

CarSage

Prepared by: **Mohamad Dib** | Version: **1.0** | Date: **September 2026**

1. Overview

This document presents the main screens and user flow for the CarSage MVP, generated with Google Stitch (AI UI design tool) using the British Racing Green brand palette. It covers the 2 foundational features (Car Onboarding, Car Profile) and 2 core features (Trip Planner, AI Advisor) approved by the project mentor, plus the supporting screens needed for a working end-to-end product: a landing page, authentication, and a dashboard hub.

Initial AI-generated drafts included several features beyond the approved MVP scope (e.g., a maintenance ledger, document vault, insurance integration, live map/telemetry features, and a mechanic booking flow). These were identified and removed in a revision pass so the wireframes accurately reflect only what will be built by the Sept 25 deadline.

2. User Flow

The diagram below shows how a user moves between the 7 screens, from first landing on the site through using both core features.

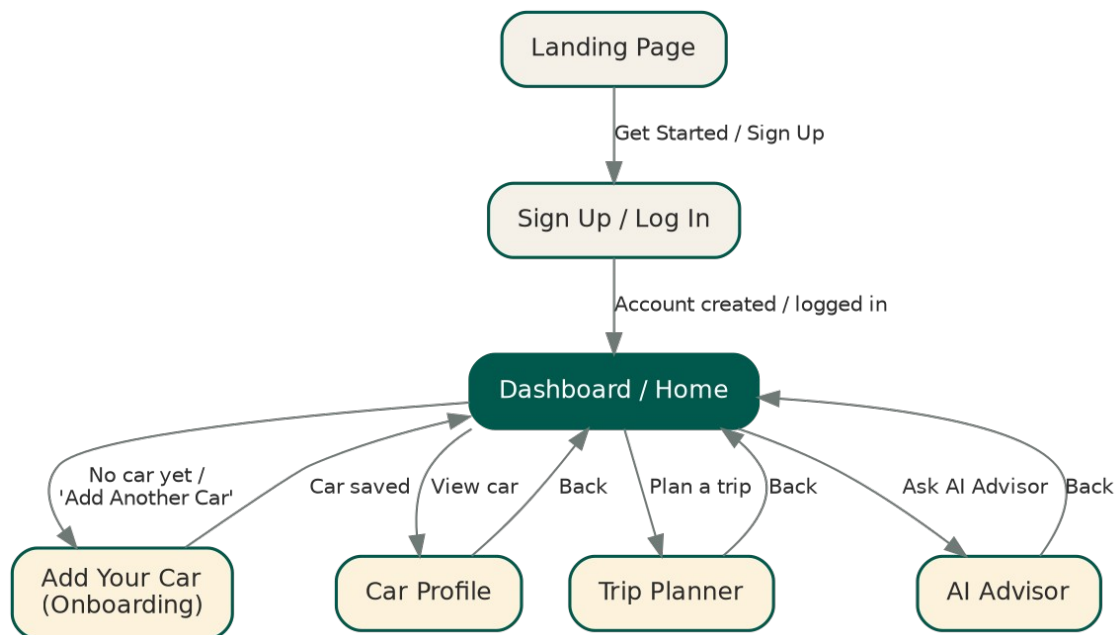

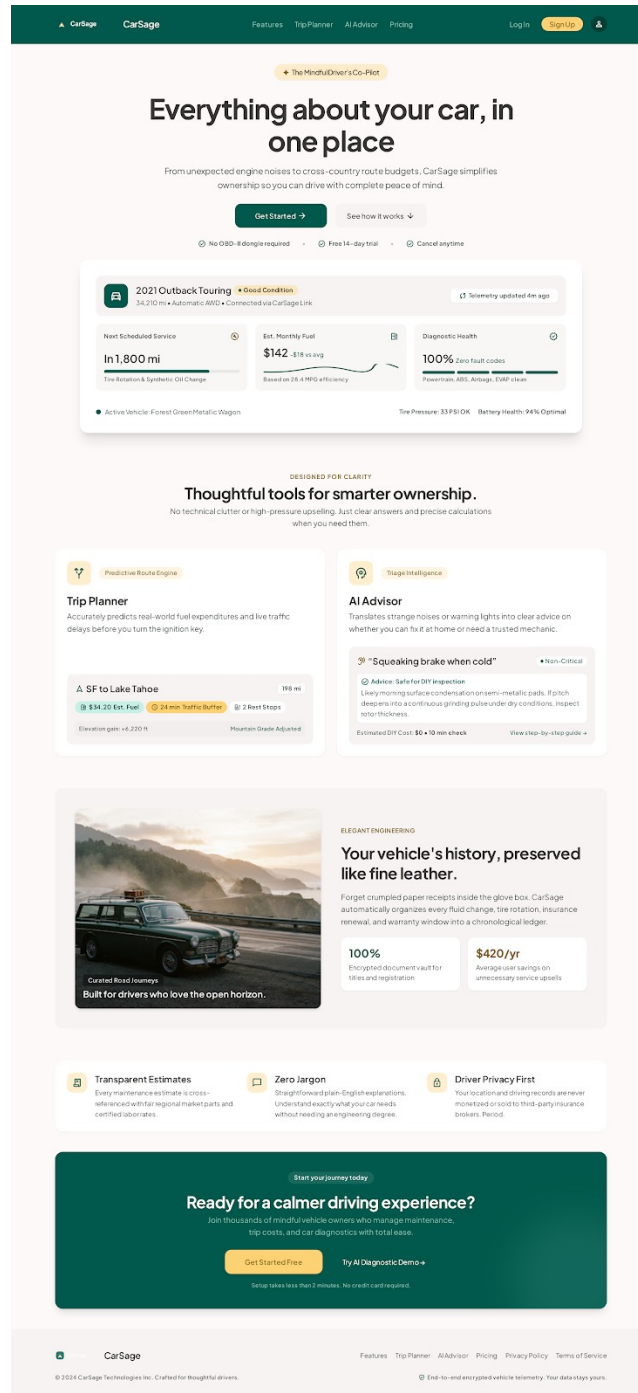

Figure 1: CarSage primary user flow

3. Screens

3.1. Landing Page

Maps to BRD feature: Project entry point (supports website validation goal in BRD)

Public marketing page introducing CarSage before signup. Since the MVP website also serves as the validation/waitlist vehicle described in the BRD, this page needs to clearly communicate the two core features to a first-time visitor.

Key elements:

- Top navigation with logo, feature links, and Log In / Sign Up buttons
- Hero headline and 'Get Started' call-to-action

- Two-column highlight of Trip Planner and AI Advisor
- Closing call-to-action banner

3.2. Sign Up / Log In

Maps to BRD feature: Required for all features (Supabase Auth)

Authentication screen using Supabase Auth. Every feature depends on a logged-in user, since all data is scoped to user_id via row-level security.

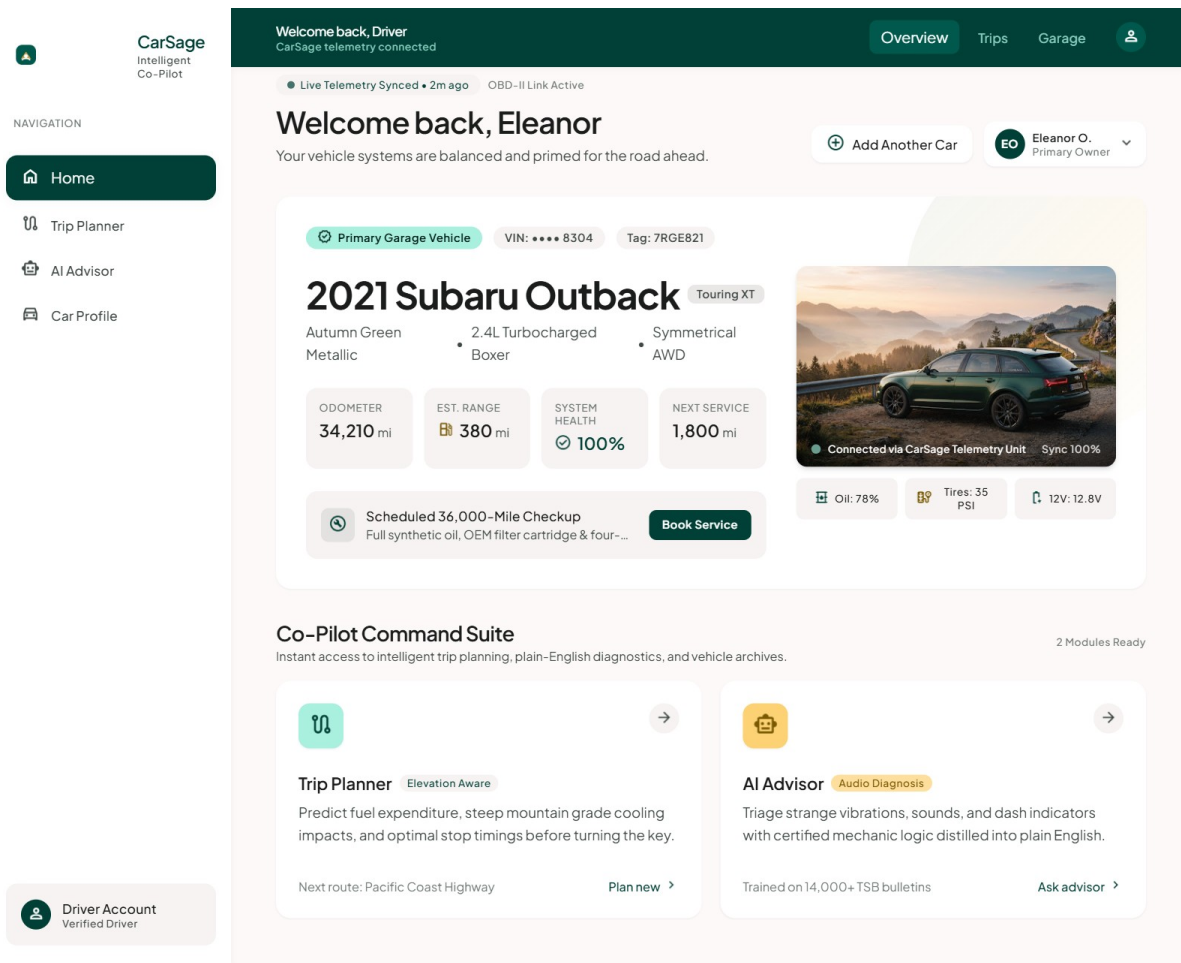

Key elements:

- Toggle between Sign Up and Log In
- Email + password fields with validation error state shown
- Social auth options (Google / Apple) as a nice-to-have, not required for MVP

3.3. Dashboard / Home

Maps to BRD feature: Navigation hub (not a standalone BRD feature, but required for usability)

The hub a user lands on after logging in. Provides a snapshot of their car and quick access to both core features.

Key elements:

- Vehicle summary card (make, model, year, odometer)
- Two module cards: Trip Planner and AI Advisor (trimmed from an original 4-card layout that included out-of-scope modules)
- 'Add Another Car' shortcut back into onboarding

3.4. Car Onboarding (Add Your Car)

Maps to BRD feature: Basic Feature 1: Car Onboarding

Lets a user add a car either by scanning their registration card (shortcut) or filling in the manual form.

Save & Exit

Everyday Driver Mode

Add Your Car

Enter your details manually or take a quick photo of your registration document.

CarSage logs are private & securely encrypted — no OBD-II hardware needed

Scan Registration Card Recommended

Instant auto-fill via phone camera or PDF upload • Takes about 5 seconds

Scan Document

OR ENTER MANUALLY

Step 1 of 2

CORE SPECIFICATIONS

Vehicle Make *
e.g. Subaru, Toyota, Volvo

Model *
e.g. Outback, RAV4, XC60

Manufacturing Year *
e.g. 2022

Engine & Powertrain
e.g. 2.4L Boxer or Dual Motor AWD

Primary Fuel Source *
Regular Unleaded (87 Octane)

License Plate
7XYZ890 CA

State/Region optional

Vehicle Identification Number (VIN)
e.g. 4S4BSANC8M3801249 17 Characters

Where can I find my VIN?
Found on driver door jamb or insurance policy card

☒ Designate as Primary Vehicle
CarSage Co-Pilot will prioritize real-time tire, weather, and fuel telemetry for this vehicle.

Add Car to Garage →

You can modify details anytime, share with family members, or connect maintenance alerts later.

Key elements:

- 'Scan Registration Card' shortcut button
- Manual entry form: Make, Model, Year, Engine Type, Fuel Type, License Plate, VIN
- 'Add Car to Garage' submit button

3.5. Car Profile

Maps to BRD feature: Basic Feature 2: Car Profile

Displays the saved specs for a user's car, with the ability to edit. Trimmed from an original version that included a maintenance ledger, document vault, and photo gallery — none of which are in MVP scope.

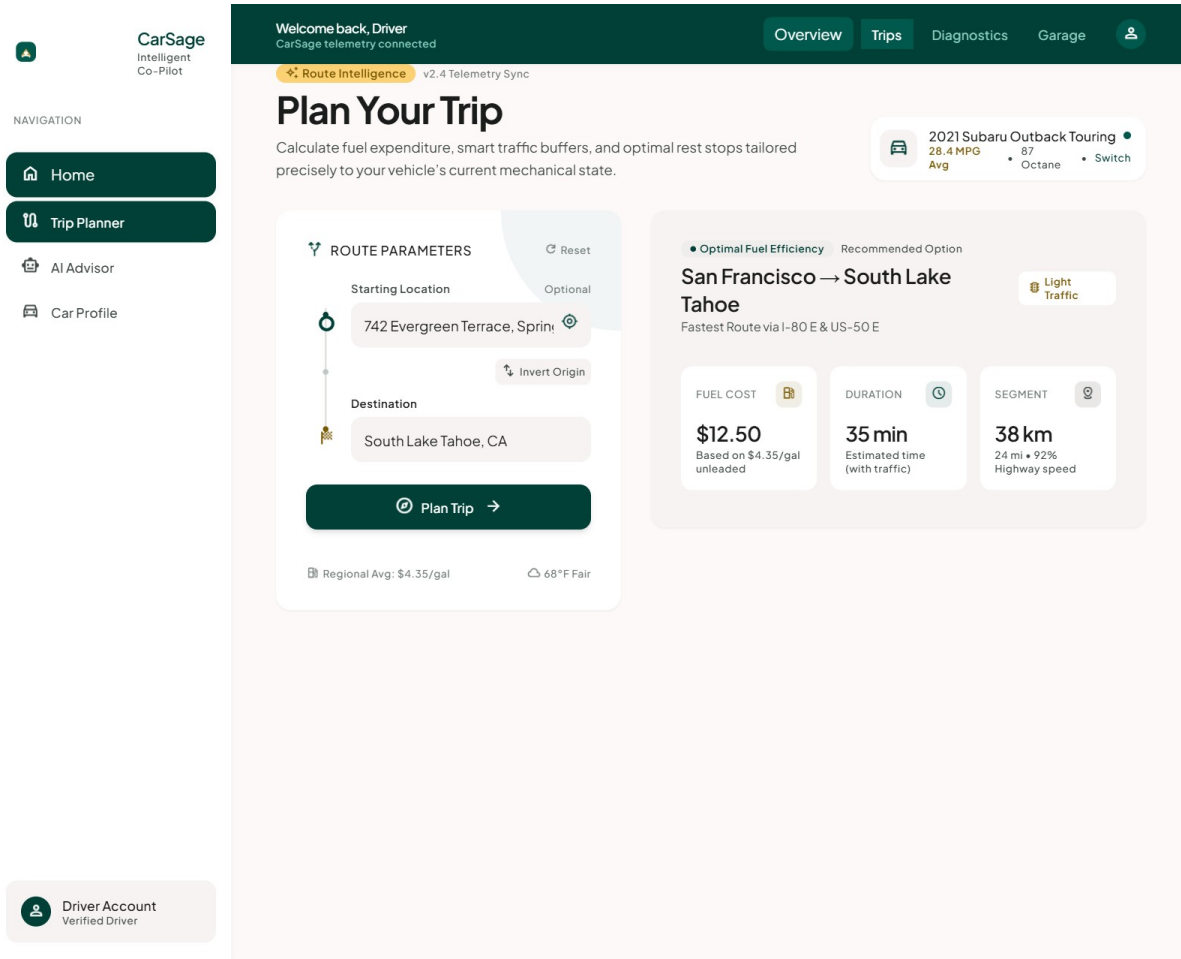

**Key elements:**

- Vehicle header with make/model/year
- Vehicle Specifications card: engine, fuel type, efficiency, plate, VIN
- Edit button

3.6. Trip Planner

Maps to BRD feature: Core Feature 1: Trip Planner

Lets a user enter a destination and get an estimated fuel cost and traffic-adjusted travel time. Trimmed from an original version that included an interactive map, waypoint recommendations, and extra route-modifier toggles not in MVP scope.

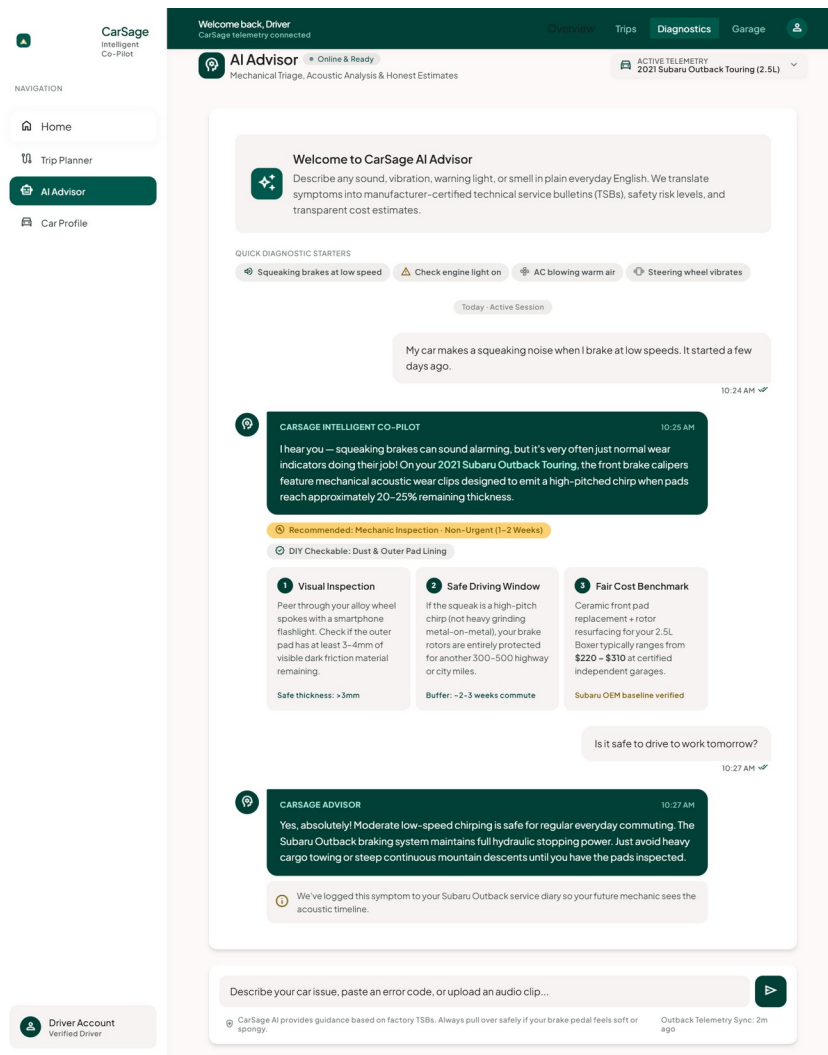

Key elements:

- Starting Location (optional) and Destination fields
- 'Plan Trip' button
- Results card: Fuel Cost, Duration, Distance

3.7. AI Advisor

Maps to BRD feature: Core Feature 2: AI Advisor

A chat-style interface where a user describes a car issue and receives a DIY-fixable or see-a-mechanic recommendation with guidance. Trimmed from an original version that included voice input, an audio sound library, mechanic booking, and report export — none of which are in MVP scope.

Key elements:

- Chat thread with user and AI message bubbles
- Clear DIY-fixable / See a Mechanic recommendation badge
- Short numbered guidance steps when DIY-fixable
- Text input field to describe an issue

4. Known Polish Items

Minor cosmetic leftovers from the AI generation process, not functional scope issues — to be cleaned up during implementation, not blocking planning approval:

- The AI Advisor input field placeholder text still references "upload an audio clip", though the corresponding icon was removed.
- The top navigation on the Trip Planner and AI Advisor screens still labels one tab "Diagnostics" instead of a scope-accurate label; this should read consistently across all screens once implemented.
